

Chip-to-Cloud IoT at Scale

of the world's largest companies.

SOC 2 certified. Deployed by some

Core Capabilities

Secure Device Connectivity

LwM2M/CoAP with DTLS. X.509 mTLS. TPM 2.0, TrustZone, PARSEC. Protocol translation for BLE, Zigbee, Z-Wave, BACnet, Modbus.

Firmware Updates (FOTA)

One-shot, continuous, mesh campaigns. Delta updates. Encrypted/signed images. Resume after disconnect.

Fleet Management

Directory scales from dozens to millions. Filter, group, suspend, bulk-operate.

Edge Computing & Monitoring

True Kubernetes. Offline containers. SD-WAN. Device Sentry incidents. Remote log/terminal.

Device Spectrum

Device Class	Stack
Constrained MCUs	Izuma Connect (Lite)
Mainstream MCUs	Izuma Connect
Rich nodes (Linux)	Izuma Connect
Gateways	Izuma Edge
Edge servers (k8s)	Izuma Edge

Deployment

Model	Infrastructure
Fully Managed	SaaS on AWS (NoOps)
Any Cloud	AWS, Azure, GKE
Bare Metal	On-premises

Why Not Build It Yourself?

Consideration	Build In-House	Izuma Device Management
Time to production	Months to years	Days
Security architecture	Design from scratch	Chip-to-cloud, SOC 2
Protocol support	Implement each	LwM2M, CoAP, BLE, Zigbee, Modbus built in
Firmware & edge	Build pipeline + k8s integration	Delta/mesh, native k8s, SD-WAN
Factory provisioning	Custom tooling	Factory Flow — works offline
Ongoing maintenance	Permanent team	Managed service (NoOps)

Key Differentiators: No vendor lock-in (Apache 2.0, standard k8s) · Single pane of glass across MCUs to edge servers · Factory Flow offline provisioning · Free tier available
