

Izuma Device Management

Chip-to-Cloud IoT at Scale

Compress years of IoT infrastructure work into a single day.

Building custom IoT device management takes months to years and diverts engineering from product differentiation. Izuma Device Management compresses that timeline from years to a day — a proven platform with over a decade of evolution (originally Arm Pelion / mbed Cloud) handling secure connectivity, firmware updates, and fleet operations from ultra-constrained MCUs to full edge servers. **SOC 2 certified**. Deployed by some of the world's largest companies.

CORE CAPABILITIES

Secure Connectivity

LwM2M/CoAP + DTLS. X.509 mTLS. TPM 2.0, TrustZone, PARSEC. Protocol translation for BLE, Zigbee, BACnet, Modbus.

Firmware Updates

One-shot, continuous, mesh campaigns. Delta updates. Encrypted/signed. Resume after disconnect.

Fleet & Edge

Directory scales to millions. True Kubernetes. SD-WAN. Device Sentry incidents. Remote log and terminal access.

DEVICE SPECTRUM

Device Class	Stack
Constrained MCUs	Izuma Connect (Lite)
Mainstream MCUs	Izuma Connect
Rich nodes (Linux)	Izuma Connect
Gateways	Izuma Edge
Edge servers (k8s)	Izuma Edge

DEPLOYMENT

Model	Infrastructure
Fully Managed	SaaS on AWS (NoOps)
Any Cloud	AWS, Azure, GKE
Bare Metal	On-premises

WHY NOT BUILD IT YOURSELF?

Consideration	Build In-House	Izuma Device Management
Time to production	Months to years	Days
Security architecture	Design from scratch	Chip-to-cloud, SOC 2 certified
Protocol support	Implement each protocol	LwM2M, CoAP, BLE, Zigbee, Modbus built in
Firmware & edge	Build pipeline + k8s integration	Delta/mesh, native k8s, SD-WAN
Factory provisioning	Custom tooling required	Factory Flow — works offline
Ongoing maintenance	Permanent engineering team	Managed service option (NoOps)

Key Differentiators: No vendor lock-in · Single pane of glass across MCUs to edge servers · Factory Flow offline provisioning · SoftBank-backed · Free tier: 200 firmware updates/month
